Claim listing (no amendments presented):

1. A flexible scintillation-type radiation detector for use in combination with a source of nuclear radiation as a level sensing gauge, comprising:

an elongated flexible tube having first and second closed ends and defining therein a scintillation chamber;

liquid scintillation material substantially filling the scintillation chamber;

said first closed end including a substantially optically-transparent first end closure member;

photodetection circuitry operably positioned relative to
the first end closure member to quantitatively detect
scintillating photons generated in the scintillation liquid
indicative of radiation passing into the scintillation chamber;
and

an opaque, flexible protective sheath substantially surrounding the flexible tube.

- 2. The detector of claim 1, further comprising an expansion chamber for accommodating volumetric expansion of the liquid scintillation material.
- 3. The detector of claim 2, wherein a slidable piston member is operably positioned in the scintillation chamber to

define a variable volume expansion chamber free of liquid scintillation material adjacent to the second end.

- 4. The detector of claim 3, further comprising a stiffener to maintain a portion of the scintillation chamber in which the piston slidably moves to substantially prevent bending thereof.
- 5. The detector of claim 3, further comprising a spring positioned to bias the piston toward the scintillation liquid.
- 6. The detector of claim 2, wherein the expansion chamber has a fixed volume and is in fluid communication with the scintillation chamber.
- 7. The detector of claim 2, wherein the expansion chamber has a variable volume, the chamber being external of and in fluid communication with the flexible tube and including a movable wall therein.
- 8. The detector of claim 7, further comprising a spring means positioned to bias the movable wall toward the liquid scintillation material.
- 9. The detector of claim 7, further comprising a member positioned to selectively immobilize the movable wall in a fixed position.
- 10. The detector of claim 1, further comprising a light reflector substantially surrounding the scintillation chamber and within the protective sheath.

Application No. 10/810,144
Response to Office Action dated January 19, 2005

- 11. The detector of claim 10, wherein the light reflector includes a flexible sheet substantially surrounding the sidewalls of the flexible tube.
- 12. The detector of claim 1, wherein the photodetection circuitry includes temperature sensing circuitry that compensates for a shift in the detection of scintillating photons as a result of temperature variation in the detector.
- 13. The detector of claim 1, wherein the flexible protective sheath is armored to resist crushing forces.
